

Humanizing Clinical Trials through Peer Connection

Real Patients. Real Connections. Real Results.

2026

The Challenge

The Patient Reality

- Limited personalization and human interaction
- Lack of trust in the research process
- Unclear expectations and poor communication

The Sponsor Impact

- 30% Average dropout rate in clinical trials
- \$19k+ to replace a patient drop-out
- 20-40% non-adherence rates depending on trial complexity

What We Know

Overly complicated and demanding protocols lead **patients to feel overwhelmed and withdrawal**

Scout Clinical

Misinformation and lack of peer support systems are increasingly (negatively) shaping public attitudes toward trial participation

2025 Velocity Clinical Survey

Patients experienced role **confusion, emotional burden, and lack of support**, especially when peer support structures were absent

BMC Medicine, (2024 Review of 40k Patients)

Why Does This Matter?

Driving trial participation is essential

but the human connection through relatable peers drives high retention and deeper engagement.

How We Drive Value

STUDY TIMELINE

PLANNING & DESIGN

SHAPE

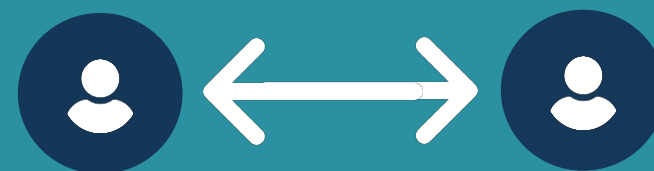

Mentors help shape the study by providing feedback on trial design, ensuring it reflects patient needs and realities.

• CoDesign • Validate •

RECRUITMENT

SHARE

Mentors share their trial experiences to build trust, reduce barriers, and demystify participation.

• Empower • Motivate •

RETENTION

SUPPORT

Mentors provide ongoing emotional and practical support, fostering resilience and retention.

• Reassure • Sustain •

The PatientPartner Solution

Engaged, Peer-Led Patient Community

- Tap into a trusted, engaged patient & caregiver community.
- Access real patients for protocol feedback and unmet needs analysis.
- Pair experienced patients with new trial participants using relatable matching for optimized support.
- View program performance in real time to assess performance drivers and barriers.

National Coverage Across The US with
Over 60,000+ Members and 1,000+ Mentors

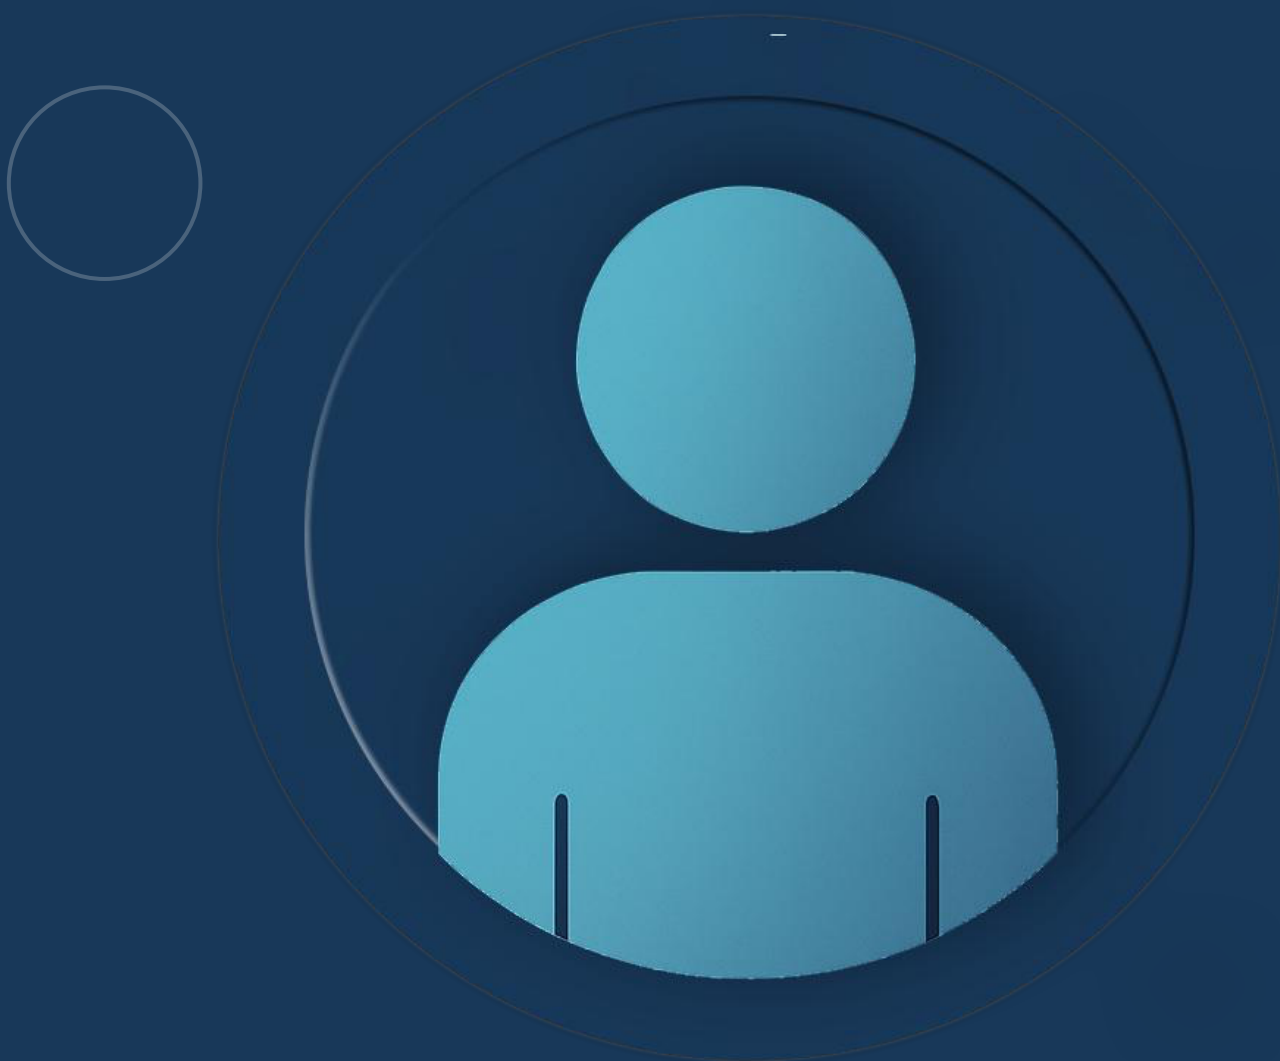

Supports over 100+ Health Conditions

- | | |
|-----------------------|---------------------------|
| ✓ Diabetes/Obesity | ✓ Digestive abnormalities |
| ✓ Oncology | ✓ Uterine fibroids |
| ✓ Rare/orphan disease | ✓ Women's health |
| ✓ Infertility | ✓ Immunology |
| ✓ MDD | ✓ Chronic pain |
| ✓ Arthritis | ✓ Epilepsy |
| ✓ MASH | ✓ Schizophrenia |
| ✓ IBD | ✓ Gene Therapy |

An Illustrative Trial Engagement Timeline

Dialogue is both mentor and mentee led, with realtime support available.

Mentors can proactively assist during burdensome study visits, mentees can seek emotional support as needed.

These sessions can be based on scripted questions, or be simple check-in calls. The timing and content of these sessions are fully configurable.

Platform Features for Clinical Trials

Compliant Communication

- Leverage HIPAA-compliant messaging
- Monitored conversations
- Audit trail capabilities

Mentor Management

- Leverage verified trial experience
- Training certification
- Performance tracking

Analytics Dashboard

- Real-time engagement metrics
- Conversion tracking
- ROI measurement

Integrations Capability

- Trial management systems
- Recruitment workflows
- Reporting tools

Impact Metrics & ROI

Meeting Patient Needs

70%

of patients express interest in having access to peer support during trials (1)

Delivering Sponsor ROI

68%

Of patients **take the next step** in their journey following a mentor engagement.

Trial Consent

Patients with peer partners report a **greater understanding of the consent process**

Trial Adherence

Patients engaged in the program have a **22% increase in adherence**

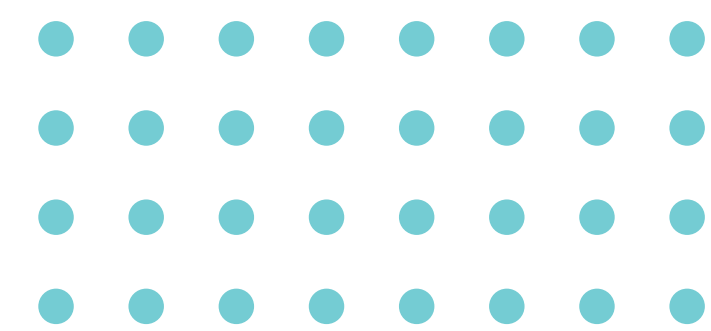

Site Efficiency

Peer mentors can **absorb part of the 40% of site time** spent on patient questions, expectations and emotional support

Time and Cost

Increased retention results in time avoidance of >4 weeks and cost avoidance of 6-8k per patient

Built for Pharma from the Ground Up

License Structure & Deployment Timeline

Program Implementation in < 8 weeks

Set up Fee + annual subscription tied to enrollment targets

Flexible licensing: single study or multi-study by disease or therapy area

Case Studies

Unlocking Unmet Patient Needs To Support Competitive Trial Experience

A leading pharma client seeks to gain unique insights from patients for consideration in trial design & delivery (Oncology)

Background & Context

Despite the physical challenges of their condition, patients consistently reported a heavier emotional burden, stemming from altered self-image, stigma, isolation and loneliness.

A critical unmet need has emerged: a need for mental health support due to disease impact on emotional vulnerability and social isolation.

Approach

A pharma sponsor leveraged the Patient Partner patient community for co-design sessions, while leveraging co-design participants as mentors:

- **Identifying patients with lived experience** directly from the Patient Partner community to co-create a study design that would be representative of patient needs
- **Surveying for clinical, behavioral and demographic implications** surfaced a common theme amongst patients – depression and anxiety was self-reported in the vast majority of patients
- **Patient focus group** enabled a deeper dive into patient emotional health and opportunities to enhance the trial experience and offer much needed patient emotional support
- **Mentor engagement** on the Patient Partner platform validated patient satisfaction with emotional support embedded into the trial design and through the mentorship program

Participant Impact

Mentor-Mentee Interactions

Study Impact

Mental Health assessments (PRO) included throughout trial

Mental health support embedded as an offering for patients in trial (competitive advantage)

Site sensitivity and empathy training prioritized

Supporting Prospective Trial Patients in Enrollment Decisions

A leading pharma in dermatology sought to overcome enrollment hesitancy through peer engagement

Background & Context

Despite an abundance of available patients who were expressing interest (spending time on the trial landing page, pre-screening etc), conversion rates to screening and enrollment were extremely low.

Feedback from patients identified a lack of trust in research, a feeling of defeat after poor experiences on other therapies, and fear of the unknown.

Approach

A pharma sponsor leveraged peer-based mentors with lived trial experience to combat inertia

- **Call to action to connect with a peer mentor** was placed across existing recruitment materials and channels (“connect to someone who has been where you are”)
- **Mentors were trained**, a dedicated compliant site for peer communication was branded for the study, and patients were paired to a matched mentor within 24 hours of expressing interest
- **Peer based discussions** helped normalize the trial experience, validate treatment concerns and demystify trial participation
- **Mentors remained available to patients** throughout the screening and enrollment period

Impact

72% who connected with a mentor moved to the next step of speaking with a coordinator

38% who connected with a mentor consented for treatment

81% agreed their mentor made them feel more comfortable with the treatment decision

39 patients returned as a mentor
